Date: 10 March 2025

2. Introduction

This project implements a Python script designed to check if a number is prime and to generate a list of prime numbers up to a specified limit. A prime number is a natural number greater than 1 that cannot be formed by multiplying two smaller natural numbers. This script allows the user to input a number to check its primality, and it also allows the user to generate a list of all prime numbers up to a given limit.

Purpose:

- To determine whether a given number is prime.

- To generate a list of prime numbers within a defined range.

3. Methodology

The methodology for creating the Prime Number Generator and Checker involves:

1. Prime Number Check (is_prime function):

- A function that checks if a number n is prime by iterating through all integers from 2 to the square root of n (as prime factors are limited to this range).
- If the number is divisible by any of these integers, it is not prime; otherwise, it is prime.

2. Prime Number Generator (generate_primes function):

- A function that generates all prime numbers from 2 up to the specified limit by calling the is_prime function for every number in that range.

3. User Interaction:

- The program asks the user to input a number for checking primality.
- The program also asks for a limit to generate and display all prime numbers up to that

Steps:

1. Define a function `is_prime` that checks whether a given number is prime.
2. Define a function `generate_primes` that iterates through numbers up to the specified limit, calling the `is_prime` function for each.
3. Prompt the user to input a number to check if it's prime and a limit for generating prime numbers.
4. Display the results to the user.

Code Typed

```
# Function to check if a number is prime
```

```
def is_prime(n):
```

```
    if n <= 1:
```

```
        return False
```

```
    for i in range(2, int(n**0.5) + 1):
```

```
        if n % i == 0:
```

```
            return False
```

```
    return True
```

```
# Function to generate a list of prime numbers up to a  
given limit
```

```
def generate_primes(limit):
```

```
    primes = []
```

```
    for num in range(2, limit + 1):
```

```
        if is_prime(num):
```

```
            primes.append(num)
```

```
    return primes
```

```
# Example usage
```

```
number = int(input("Enter a number to check if it's prime:  
"))
```

```
if is_prime(number):
```

```
    print(f"{number} is a prime number.")
```

else:

```
print(f"{number} is not a prime number.")
```

```
limit = int(input("Enter a limit to generate prime numbers:"))
```

```
prime_list = generate_primes(limit)
```

```
print(f"Prime numbers up to {limit}: {prime_list}")
```

Sc

The screenshot shows a code editor window titled "checking_prime_number". The menu bar includes File, Edit, View, Insert, Runtime, Tools, and Help. The left sidebar contains icons for a menu, search, code, text, and a terminal. The main editor area displays a Python script with a single line of code: `print(f"Prime numbers up to {limit}: {prime_list}")`. Below the code, the output of the script is shown: "Enter a number to check if it's prime: 45", "45 is not a prime number.", "Enter a limit to generate prime numbers: 4", and "Prime numbers up to 4: [2, 3]". The bottom status bar shows a weather icon with "4 85°F Haze", a Windows logo, a search bar with "Search", and a green checkmark with "10".
